

AGENT PLATFORM READINESS REVIEW

A two-week look at whether your platform can carry a second team.

We review evaluation gates, identity and gateway, cost controls and your Azure landing zone, then walk your engineers through what production needs first.

What it covers

Evaluation gates

How a new agent version is tested before it ships, and whether a missed threshold stops the release.

Identity and gateway

Whether every model call is tied to an identity and passes one gateway, so it can be attributed to a team and a purpose.

Cost controls

Whether spend is visible by team and read against what shipped, not only as a total.

Landing zone

Whether the Azure foundation (identity, network, policy) can carry a second team without a rebuild.

What you get

- Written findings for each of the four areas.
- A prioritized list of what production needs first, in the order to do it.
- A working session where we walk your engineers through it.

Who it's for

- Engineering, platform, security or technology leaders at enterprise and mid-market organizations.
- You have an agent in pilot or early production on Azure and GitHub, and a second team is about to build on it.

How it runs

01

Discovery call

Thirty minutes on your platform and team. Bring your scorecard or checklist result.

02

Scope agreed in writing

We confirm what is in and out before any work starts.

03

Two-week review

We assess the four areas against what you are running.

04

Readout and next step

We walk through the findings. Continuing with us is your choice.

What it isn't

An engineering assessment. It makes no compliance, certification or data residency finding. We scope it on a discovery call, and Kevin Evans leads every engagement, bringing in engineers when it needs more hands.

Ready to talk it through?

Book a discovery call and bring your score.
